**Installing the XPT Transmitter Base**

In a standard single gang wall box, connect the Black wire from the XPT Base to 120V AC Live and connect the White wire to Neutral, using the included wire nuts. Make sure no bare whiskers of wire are protruding, use insulation tape to cover if necessary.

Note: The XPT does not switch any loads, it is a transmitter only.

After you have secured the transmitter to the box, set the House and Unit code dials to the desired settings. The red House Code dial should be set to match the receiver modules that you want to control. The black Unit Code dial should be set to the first of four sequential commands.

Note: if you are only controlling one device, as with an XP1 Keypad, the Unit Code that you set it to will be the unit number transmitted. If you use an XP4 Keypad, the first command will be the unit number that the XPT is set to, and the next three commands will be sequentially above.

Note, the XPT automatically monitors the power line for noise and other signal transmissions and will not transmit until the line is clear.

Place the desired Keypad cover onto the XPT Base by inserting the tab on top of the Keypad under the notch on the XPT Base. Gently press the bottom of the Keypad into place so that the pins on the back of the Keypad insert into the XPT Base socket.

A variety of Keypads are available allowing each installation to be customized:

XP1: 1 button 1 address On/Off
XP1A: 1 button 1 address All Lights On/All Units Off
XP2: 2 button 2 address On/Off
XP2D: 2 button 1 address On/Off, and Bright/Dim
XP4: 4 button 4 address On/Off
XP4D: 4 button 3 address On/Off, and Bright/Dim
XP4A: 4 button 3 address On/Off, and All Lights On/All Units Off
